

Q1. Formatting Large Products

Rohan needs to compute the product of all integers from **A to B (inclusive)**. Since the product can be extremely large, represent the result in the format **D * 10^E**, where **D** is the value after removing trailing zeros from the product and **E** is the number of trailing zeros removed.

Create a Function

formatProducts(A, B)

The function should return the result as a string in the format **D * 10^E**.

Rules

- Compute the product **C = A × (A+1) × ... × B**
- Remove all **trailing zeros** from C
- Let the remaining value be **D**
- Let **E** be the number of trailing zeros removed
- The **last digit of D must not be zero**

Constraints

- $1 \leq A \leq B \leq 1,000,000$

Sample Input

1
5

Sample Output

12 * 10^1
